

## Second High Purity Mixed Rare Earth Carbonate Produced from Column Leach

Engage with this announcement on our interactive [Investor Hub](#)

ANSTO has produced second mixed rare earth carbonate (MREC) sample product from Deep Leads deposit in northern Tasmania

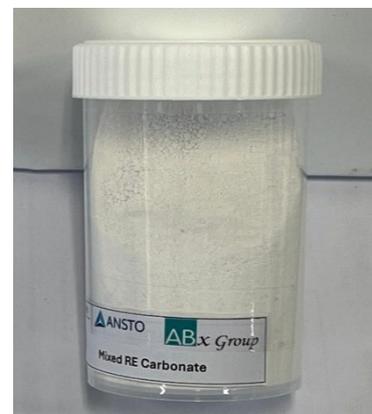

Quality is even better than maiden MREC – more heavy rare earths and less of the most important impurities

Results provide ABx with broad flexibility and scope for project optimisation

On behalf of ABx Group Limited (ASX: ABX) (**ABx** or the **Company**), the Australian Nuclear Science and Technology Organisation (ANSTO) has produced the second mixed rare earth carbonate (MREC) sample from the Deep Leads resource in northern Tasmania. This sample was produced from the leachate generated in the recently reported column leach testwork.<sup>1</sup> Compared to the maiden ABx MREC, this MREC contains even higher proportions of the most valuable heavy rare earths, such as dysprosium (Dy) and terbium (Tb) (Table 1), and significantly lower amounts of the key impurities, aluminium and iron.

**Table 1: Proportions of REO in ABx MRECs. Full results in Table 2**

Rare earth oxide (REO)	Maiden MREC	Second MREC
La <sub>2</sub> O <sub>3</sub>	17.5%	16.7%
CeO <sub>2</sub>	5.6%	1.1%
Pr <sub>6</sub> O <sub>11</sub> + Nd <sub>2</sub> O <sub>3</sub>	28.3%	28.3%
Sm <sub>2</sub> O <sub>3</sub> + Eu <sub>2</sub> O <sub>3</sub> + Gd <sub>2</sub> O <sub>3</sub>	10.9%	12.0%
Tb <sub>4</sub> O <sub>7</sub> + Dy <sub>2</sub> O <sub>3</sub>	4.6%	5.4%
Other HREO	5.2%	6.5%
Y <sub>2</sub> O <sub>3</sub>	27.8%	30.0%
Total	100.0%	100.0%

**Figure 1: Second MREC sample produced from Dee Leads**

### ABx Group Managing Director and CEO Mark Cooksey said:

*“This is another example of the high purity MREC that can be produced from Deep Leads using the simple three-step process that has been used commercially for many decades. Significantly, it indicates that ABx can produce a high quality MREC using either a tank leach or a column leach. This provides ABx with broad flexibility and scope for project optimisation.*”

<sup>1</sup> ASX Announcement, 23 January 2026

### **Bulk Sample Material**

The source of the material for the MREC sample is a 100 kg bulk sample from trial pit DLP002 from the Deep Leads resource (Figure 1).<sup>2</sup>

### **Mixed Rare Earth Carbonate Product Quality**

See Table 2 for detailed composition. Compared to the maiden ABx MREC, this MREC contains even higher proportions of the most valuable heavy rare earths, such as dysprosium (Dy) and terbium (Tb), and lower amounts of cerium (Ce), the least valuable rare earth.

The most important impurities in MRECs are typically aluminium and iron. The levels of both are incredibly low, with the iron below the detection limit.

The uranium and thorium contents are very low and similar to the maiden MREC, which has already been shown to meet the exemption criteria for control as set by the International Atomic Energy Agency.<sup>3</sup>

### **Next Steps**

The second MREC enables ABx to provide samples to even more prospective customers and offtake partners. The results are also valuable input to the engineering studies underway with external experts.

### **Strategic Importance of MREC Production**

Existing and prospective rare earth refineries are seeking high quality MRECs produced at low cost. MRECs with high proportions of heavy rare earths such as Dy and Tb are in particular demand because these elements have the most acute supply risk.<sup>4</sup> ABx has excellent prospects of meeting these requirements because:

1. ABx achieved high extractions at ambient temperatures and pressures with minimal acid in a short time, which is likely to lead to lower cost and lower impurities in the MREC product. For most clay-hosted rare earth deposits globally, minimal rare earth extraction is achieved using these process conditions;
2. The ABx MREC has a significantly higher proportion of Dy and Tb compared to peers. Magnet rare earth prices remain high, with Benchmark<sup>5</sup> reporting Dy oxide (DDP China) at over US\$200/kg and Tb oxide (DDP China) at over US\$900/kg. Furthermore, CIF Europe prices for Dy and Tb are over four times higher than Chinese domestic prices, illustrating the potential premium for non-China sources of rare earths.

<sup>3</sup> ASX Announcement, 2 March 2026

<sup>4</sup> ASX Announcement, 23 April 2025

<sup>5</sup> Benchmark Mineral Intelligence, 5 March 2026

ABx has already executed a Memorandum of Understanding with Ucore Rare Metals Inc. (TSXV: UCU) (OTCQX: UURAF),<sup>6</sup> which is focussed on rare-earth processing facilities in North America, and ABx is also in discussions with additional potential offtake partners.

### ABx Rare Earth Resource

The Deep Leads – Rubble Mound and Wind Break discoveries contain a resource estimate of 89 million tonnes<sup>7</sup> averaging 844 ppm total rare earth oxides (TREO). The resource contains 36 ppm Dy+Tb (Dy+Tb is 4.4% of TREO), the highest of any ionic clay deposit in Australia and among the highest globally.<sup>8</sup>

This resource estimate has been defined from only 29% of the project's mineralised outline.

### About ABx Group Limited

ABx Group Limited (ABx) is a uniquely positioned Australian company delivering materials for a cleaner future.

The three priority projects are:

- **Heavy rare earths:** Supplying light and heavy rare earths from Tasmania into Western supply chains
  - Maiden mixed rare earth carbonate produced
  - Processing Options Analysis conducted in partnership with external experts
- **Clean fluorine chemical production:** Producing industrial chemicals from aluminium smelter by-product (ALCORE)
  - Continuous pilot plant under construction in Bell Bay, Tasmania

---

<sup>6</sup> ASX Announcement, 4 September 2024

<sup>7</sup> 41 Mt inferred, 42 Mt indicated and 6 Mt measured

<sup>8</sup> ASX Announcement, 2 May 2024

- **Near-term bauxite production:** Mining bauxite resources for the aluminium, cement and fertiliser industries
  - Agreements executed with Good Importing International for bauxite projects in Queensland and New South Wales, and \$2.7 million initial payment has been received
  - Approvals well advanced for DL130 bauxite project in northern Tasmania

ABx endorses best practices on agricultural land and strives to leave land and environment better than we find it. We only operate where welcomed.

### Disclaimer Regarding Forward Looking Statements

This ASX announcement (Announcement) contains various forward-looking statements. All statements other than statements of historical fact are forward-looking statements. Forward-looking statements are inherently subject to uncertainties in that they may be affected by a variety of known and unknown risks, variables and factors which could cause actual values or results, performance, or achievements to differ materially from the expectations described in such forward-looking statements.

ABx does not give any assurance that the anticipated results, performance, or achievements expressed or implied in those forward-looking statements will be achieved.

### Competent Persons Statement

The information in this report that relate to Exploration Information and Mineral Resources are based on information compiled by Ian Levy who is a member of The Australasian Institute of Mining and Metallurgy and the Australian Institute of Geoscientists. Mr Levy is a qualified geologist and a director of ABx Group Limited.

Mr Levy has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration and to the activity, which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of exploration Results, Mineral Resources and Ore Reserves. Mr Levy has consented in writing to the inclusion in this report of the Exploration Information in the form and context in which it appears.

## Appendix

### Mixed Rare Earth Carbonate (MREC) Production

This MREC was produced using the standard three-step process for ionic rare earths: leaching, impurity removal and precipitation. The leaching was via a column leach with conditions as follows:<sup>9</sup>

- Ore was homogenised and screened at 10 mm, followed by agglomeration to a 10 mm feed to consolidate fines and ensure suitable bed structure and permeability
- Two identical columns, each 2.4 metres high and 150 mm in diameter (Figure 1)
- Approximately 26 kg of ore per column to a 'bed height' of 2m
- Two ammonium sulfate (AMS) leachate concentrations:
  - Test C1: 0.30 M ammonium sulfate
  - Test C2: 0.15 M ammonium sulfate
- Irrigation rate of ore with leachate: 5.0 L/m<sup>2</sup>/hour (approximately 2.12 L / day)
- Ambient temperature (~21°C ambient conditions)
- Target pH: 4.0 (actual feed pH ~3.8).
- Test duration: 24 days
- Discharge liquor collected daily (except Sunday) and stored separately
- Post-test treatment: Column flushed with 8 L of tap water at 15 L/m<sup>2</sup>/hour (~30hrs). Column allowed to discharge under gravity for >13-15 days. Solid residue discharged (Figure 1)

Following the column leaching, all discharge liquor from both columns was combined to produce 95L of rare earth enriched liquor.

Impurity removal was performed by addition of 150 g/l ammonium bicarbonate solution to the liquor to achieve a target pH 6.2 and allowing 30 minutes for impurity precipitation. The solution was filtered to separate the clean liquor from the minor residue.

Rare earth precipitation was achieved by further addition of the ammonium bicarbonate solution to achieve a target pH of 7.5 which was held for 2 hours. The MREC product was separated from the barren liquor by filtering and flushing to ensure maximum recovery. The damp filter cake was dried at 55°C to produce 119g of MREC. A sub-sample of the MREC is undergoing gamma-counting to determine its total radioactivity, with results expected in May.

<sup>1</sup> MREC is normalised to MREO by calculating the expected product composition after calcination to a moisture-free and hydration-free mixed oxide state, i.e. containing only rare earth oxides and impurity oxides

<sup>2</sup> Chinese Standard has been normalised to remove 1.5% loss on ignition

<sup>3</sup> NdPr = Pr<sub>6</sub>O<sub>11</sub> + Nd<sub>2</sub>O<sub>3</sub>, DyTb = Tb<sub>4</sub>O<sub>7</sub> + Dy<sub>2</sub>O<sub>3</sub>

<sup>4</sup> Includes other impurities not individually listed

**Figure 2: Trial pit locations at Deep Leads**

**Table 3: Summary of sampling information referred to above, in accordance with LR 5.8.1**

<b>Geology and geological interpretation</b>	REE mineralisation occurs in clay layers that overlie a Jurassic age dolerite basement in a district with some residual weathered Tertiary age alkali basalt.
<b>Sampling and sub-sampling techniques</b>	Pit sampling was done at 1 metre intervals using a large excavator with an 8 metre boom. Subsampling of ~100kg was performed by fractional shovelling. This sample was lightly disaggregated and hand-screened at 10mm without drying.
<b>Drilling techniques</b>	Not applicable (N.A.). Bulk pit sampling by excavator
<b>Criteria used for resource classification, drill &amp; data spacing &amp; distribution.</b>	N.A.
<b>Sample analytical method</b>	Assay samples are analysed by standard NATA-approved induction coupled plasma analytical methods for rare earth elements at ALS labs in Brisbane (method ME-MS81). Interlab comparisons were satisfactory.
<b>Estimation methodology, cut-off grade, mining, metallurgy &amp; other modifying factors</b>	All N.A.
